

# SonicAir™

## Ready, Set, Go Wireless

Maybe we're a little spoiled. We want great sound everywhere in our homes. The kitchen. The bedroom. The patio. Maybe even the garage. But when we can carry thousands of songs on devices the size of a wallet, the idea of confining our music to the living room seems as silly as using a phone with a wired handset.

The SonicAir wireless audio system gives you great sound in all those places and more. You don't need a team of installers to run speaker cables. You don't need to have holes cut in your walls. You don't need to sweep up drywall dust afterward.

SonicAir's wireless technology lets you use it wherever you're living: a house, an apartment, a condo, a loft, a townhome. And when you move, you can take it with you.

## SonicAir™

The SA 2.1 is a tremendous solution for transmitting audio signals through a home with very little time and effort. A two piece system made up of both a transmitter and a receiver, the SA 2.1 is perfect for sending rear channel information to the back of the room, a subwoofer signal to a corner location or even a second zone's audio to one or more bedrooms.

The SonicAir transmitter connects to almost any audio source with an 1/8" output, including computers, iPods®, smart phones, game consoles, and A/V receivers. Use it to bring audio to more rooms, or to set up a home theater in minutes with no long cable runs.

### SonicAir™ SA 2.1
